SQL Server Database Size Limit

795 TDO KB October 2, 2023 Server 15.31K

TDO uses Microsoft SQL Server (2000, 2005, 2008, or 2016) to manage your database. The Express edition of Microsoft SQL Server has a 10GB limit on database files. If yours is a single-location practice, your database is most likely hosted on an Express edition of Microsoft SQL Server.

If yours is a multi-location practice (Replicated), then your primary server is most likely running a Standard edition of Microsoft SQL Server, and the satellite servers running Express.

If your single-location practice's database grows beyond 10GB, you will need to purchase a Microsoft SQL Server license (we recommend the Standard edition) with the appropriate amount of CALs.

If one (or more) of the satellite servers in your replicated practice has a database that grows beyond 10GB, you will need to buy a Microsoft SQL Server license for that location(s), with the appropriate amount of CALs.

If you have further questions, please contact your IT provider and/or TDO Support.
